

ABSTRACT

An electrode for an energy storage device containing a  
5 polyaminoquinoxaline compound of the following formula (1a)  
is provided as having a highly densified energy level and  
being small in size and light in weight.

R<sup>1</sup> and R<sup>2</sup> independently represent a hydrogen atom, a hydroxyl  
10 group, a C<sub>1</sub>-C<sub>10</sub> alkyl group, a C<sub>1</sub>-C<sub>10</sub> alkoxy group or the like,  
R<sup>3</sup> and R<sup>4</sup> independently represent a hydrogen atom, a halogen  
atom, a cyano group, a nitro group, an amino group, a C<sub>1</sub>-C<sub>10</sub>  
alkyl group, a C<sub>1</sub>-C<sub>10</sub> alkoxy group or the like, X<sup>1</sup> represents  
-NH-R<sup>5</sup>-NH- or -NH-R<sup>6</sup>- wherein R<sup>5</sup> and R<sup>6</sup> independently  
15 represent a C<sub>1</sub>-C<sub>10</sub> alkylene group, -C(O)CH<sub>2</sub>- , -CH<sub>2</sub>C(O)- or the  
like, and n is an integer of 2 or over.
